Lung and Mediastinum Cytohistology-Syed Z. Ali 2012-04-05 "History of Respiratory Cytopathology Application of the cytologic method to specifically examine respiratory specimens was used first in Europe by the mid-1800s, though exfoliated epithelial cells were described as early as the 18th century. Hampeln's 1897 paper is credited with the first thorough description of normal and non-malignant cellular elements seen in sputum. And, about two decades later his was one of the first publications to document the use of sputum cytology to diagnose pulmonary carcinoma in a series of 25 cases rather than a single report. Only sporadic and limited publications of respiratory cytology occurred in the early decades of the 20th century. A 3-year study of sputum cytology that culminated in a 1944 publication is considered as one of the most important contributions to clinical cytology of chest diseases in the first half of the 20th century"--Provided by publisher.

Transabdominal Fine-needle Aspiration Biopsy - Grace Chia-yu Hsu Yang 2007

Over 1,350 illustrations in 350 innovative composite figures designed to teach general pathologists the cytologic approach and cytologists the histologic basis for cytologic criteria? CD-ROM containing high resolution composite images that can be enlarged to the size of computer screen and detailed legends with clinical
presentation, cytologic clues with different stains from low to high magnification as well as the mistakes made and lessons learned? Pathologic entities are arranged in the current classifications used by surgical pathologists so that they can translate their experience in histopathology to cytopathology? New classifications of tumors based on advances in cytogenetic and molecular evidence and all new illustrated cases from G C H Yang's collection? A new chapter on gynecologic tumors has been added. The chapter on malignant lymphoma has been completely rewritten to incorporate current WHO classifications. New tumors discovered in the past 16 years and new classifications of adrenal, kidney, liver and pancreatic tumors have been added?The objective of this book is to share authors' combined 30 years' experience in the fine-needle aspiration biopsy diagnosis of organs beneath the diaphragm with general pathologists. Starting from the basics, this book progresses to in-depth cytomorphologic analysis with histologic and immunohistochemical confirmation of specific entities. Cytohistological correlation is emphasized by using composite images from either resected tumor or the cell block whenever possible. In addition, ultrastructural basis of cytological features is emphasized. Both cytology and electron microscopy classify tumors by meticulously analyzing the cytoplasmic features and cell junctions of scanty sample. Every histopathology entity should have a counterpart in cytopathology, since both derive from the same entity undergoing the same pathological process. The difference is in the artifacts; thus an attempt was made to explain the artifacts of aspiration cytology so that histopathologists may understand the cytologic approach and learn to interpret aspiration cytology with confidence.
